Typological Enclaves

Balthasar Bickel & Johanna Nichols

U. Leipzig, UC Berkeley

http://www.uni-leipzig.de/~autotyp
The phenomenon

- **Pan-Eurasian Macroarea** typological profile defined by several variables (Jakobson 1932).
- **But:** some variables reveal deviating zones in the Himalayas and/or in the Caucasus.
The phenomenon

- **Pan-Eurasian Macroarea** typological profile defined by several variables (Jakobson 1932).

- **But:** some variables reveal deviating zones in the Himalayas and/or in the Caucasus.

- These zones are **typological enclaves:**
  
  - they are accretion zones at the margins of major spread zones (Silk Road, SEA spreads)
  
  - they can but need not be areally homogenous; they can be ancient or recent.
**Method**

1. Survey variables in database suspected to have rare values and to possibly reveal enclave effects

2. Test enclave hypothesis
   - extremely skewed tables: need randomization tests
   - small cell values and high miss-sampling risk: need tolerance test based on re-sampling methods (Janssen, Zúñiga, and Bickel 2003)

3. Interpret in historical scenario model

4. Test hypotheses based on this model
   - same tests as above
Variables surveyed

1a. verb-inflectional synthesis
1b. polypersonal agreement
2. bipartite stems
3. conjunct/disjunct marking
4. multiple possessive classes
5. radically double-marking (objects and possessors)
6. perhaps AND/WITH conjunction (Stassen 2000)
A. Survey of categories that are

- **verbal**, e.g. TAM, AGR, NEG, but excluding transcategorial clitics/particles (such as Belhare or Garo interrogatives)

- **inflectional**, i.e. the marker must somehow be sensitive to the syntactic environment (e.g. AGR) or impose or require morphological paradigm/allomorphy choices (e.g. NEG interacting with tense or agreement)

- **synthetic**, i.e. not a syntactic word on its own (e.g. Khasi modal auxiliaries)

- **not necessarily phonologically bound** (e.g. Lai, Khasi TAM particles)
#1a - Synthesis: sampling

B. Survey of formative slots or morphological layers (including tonal layers)

Synthesis Index: sample maximal numbers of categories and formatives

SYN = n (categories) + n (formatives)
#1a - Synthesis: map

$N = 199$
#1a - Synthesis: analysis

<table>
<thead>
<tr>
<th>N</th>
<th>Mann-Whitney’s</th>
<th>Randomized ANOVA</th>
<th>.05-Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>56</td>
<td>$U=206.5$, $p=.017$</td>
<td>$F=8.73$, $p=.004$</td>
<td>$T_{sd}=1.2$</td>
</tr>
</tbody>
</table>

$N$ (randomizations) = 10,000
Unconditionally obligatory verb agreement with more than one argument

Example: Belhare (Sino-Tibetan, Himalayas)

\[ ma-\eta-lur-he \]
1SG.P-3PL.A-tell-PAST
‘They told me’

Excluding

- optional agreement as in, e.g., many Bantu lgs (Swahili example):

\[ u-me-(ki-)leta \quad ki-tabu? \]
2SG.A-PERF-VII.P-bring VII-book
‘Have you brought a (the) book?’

- all kinds of pronominal agreement (agreement in complementary distribution with some NP position)
#1b - Polyagreement: map

*N = 277*
#1b - Polyagreement: analysis

<table>
<thead>
<tr>
<th></th>
<th>Fisher’s</th>
<th>Randomized Chi2</th>
<th>.05-Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>57</td>
<td>$p=.002$</td>
<td>$\chi^2=8.91, p=.002$</td>
<td>$T_{add}=4, T_{sub}=2$</td>
</tr>
</tbody>
</table>

$N$ (randomizations) = 10,000
#2 - Bipartite stems: sampling

- First identified by Jacobsen 1980 in Washo (isolate, N. California).

- Himalayan example from Belhare:
  
  - *laʔu-ma* ‘dance-INF’
  
  - *la*  *ŋŋ-u-yakt-he*
    
    dance 3nsg.S-dance-IMPERFECTIVE-PAST
    
    ‘They were dancing.’

- Data collection incomplete; current sample *N* = 122
#2 - Bipartite stems: map

\( N = 122 \)
#2 - Bipartite stems: analysis

<table>
<thead>
<tr>
<th>$N$</th>
<th>Fisher’s $p$</th>
<th>Randomized Chi2 $\chi^2$</th>
<th>.05-Tolerance $T_{add}=1, T_{sub}=0$</th>
</tr>
</thead>
<tbody>
<tr>
<td>38</td>
<td>$p=.020$</td>
<td>$\chi^2 = 4.73, p=.024$</td>
<td></td>
</tr>
</tbody>
</table>

$N$ (randomizations) = 10,000
#3: Conjunct/disjunct: sampling

**CONJ** = Informant is \{agent, ...\}

**DISJ** = Informant is not \{agent, ...\}

Newar (Hargreaves 1990)

- aːpwa ton-ā /la?
  - too.much drink-CONJ.PAST Q
  - ‘I drank too much’ / ‘Did you drink too much?’

- aːpwa ton-a /la?
  - too.much drink-DISJ.PAST Q
  - ‘You/s/he drank too much’ / ‘Did I/s/he/drink too much?’
#3: Conjunct/disjunct: sampling

**Awa Pit** (Barbacoan; Ecuador - Columbia border region; Curnow 2000)

\( k\text{"in-}k\text{"a}=n\text{"a}, \quad n\text{"a}=n\text{"a} \quad \text{Santos}=t\text{"a}izh-ta-w. \)

dawn-when=TOP 1SG[NOM]=TOP S.=ACC see-PT-CONJ.SUBJ

‘At dawn I saw Santos.’

\( s\text{"hi} \quad a\text{"yuk}=t\text{"a}=m\text{"a} \quad l\text{"i}bro \quad t\text{"a-ta-w}? \)

what inside=LOC=Q book put-PT=CONJ.SUBJ

‘Under what did you put the book?’

\( p\text{"i}n\text{"a} \quad a\text{"u} \quad k\text{"i-ma}t\text{"i}-z\text{"i}. \)

very rain do-PFV-PT-DISJUNCT

‘It rained heavily.’
#3: Conjunct/disjunct: results

Attested in the Himalayas, and only once elsewhere (in S. America). Nowhere else in a database of 350 languages!
#4 - Multiple poss. classes: sampling

Possessive declension classes or lexically determined constructional possessive class distinctions.

Typical examples:

- Diegueño (Yuman, California)
  - \( ?-\text{etal} \) ‘my-mother’ vs. \( ?-\text{en} \)-\text{ewa} ‘my-house’

- Warndarang (Maran, Australia)
  - \text{ng-baba} ‘my/our-father’ vs. \text{wuradburru ngini} ‘country my’
#4 - Multiple poss. classes: sampling

Multiple possessive classes:

**Anêm** (New Britain Stock; Papua New Guinea)

<table>
<thead>
<tr>
<th></th>
<th>‘water’</th>
<th>‘child’</th>
<th>‘leg’</th>
<th>‘mat’</th>
</tr>
</thead>
<tbody>
<tr>
<td>1sg</td>
<td><em>kom-i</em></td>
<td><em>gi-ng-e</em></td>
<td><em>ti-g-a</em></td>
<td><em>mîk-d-at</em></td>
</tr>
<tr>
<td>2sg</td>
<td><em>kom-î</em></td>
<td><em>gi-ng-ê</em></td>
<td><em>ti-g-îr</em></td>
<td><em>mîk-d-îr</em></td>
</tr>
<tr>
<td>3sgM</td>
<td><em>kom-u</em></td>
<td><em>gi-ng-o</em></td>
<td><em>ti-g-î</em></td>
<td><em>mîk-d-it</em></td>
</tr>
<tr>
<td>3sgF</td>
<td><em>kom-îm</em></td>
<td><em>gi-ng-êm</em></td>
<td><em>ti-g-î</em></td>
<td><em>mîk-d-it</em></td>
</tr>
</tbody>
</table>

(4 out of 20 classes)
#4 - Multiple poss. classes: sampling

Himalayan example:
**Limbu** (Sino-Tibetan, Nepal)

<table>
<thead>
<tr>
<th></th>
<th>Class I</th>
<th>Class II</th>
<th>Class III (default)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect</td>
<td>Nasalization</td>
<td>Stem reduction</td>
<td></td>
</tr>
<tr>
<td>1sg form</td>
<td><em>am-bhọja?</em> ‘my uncle’</td>
<td><em>a-nsa? (&lt; nusa?)</em> ‘my sibling’</td>
<td><em>a-yuma</em> ‘my grandmother’</td>
</tr>
<tr>
<td>sample members</td>
<td>friend, father, mother, aunt etc.</td>
<td>head, older sister, moustache, sibling, etc.</td>
<td></td>
</tr>
</tbody>
</table>
#4 - Multiple possessive classes: map
#4 - Multiple possessive classes: analysis

<table>
<thead>
<tr>
<th>$N$</th>
<th>Fisher’s</th>
<th>Randomized Chi2</th>
<th>.05-Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>50</td>
<td>$p = .012$</td>
<td>$\chi^2 = 7.83, p = .012$</td>
<td>$T_{add} = 1, T_{sub} = 0$</td>
</tr>
</tbody>
</table>

$N$ (randomizations) = 10,000
#5 - Radically 2-marking: sampling

- Double-marking (optional or unconditional) of both Possessor and Object (any kind) relations.

Himalayan example:

a. \( sa-ti \ lui-t-u? \)
   who-ABS.SG tell-NPT-3SG.P
   ‘Who did s/he tell?’

b. \( sa-ha \ u-khim? \)
   who-GEN 3SG.POSS-house
   ‘Whose house?’

- Subject (S, A) relation excluded from sampling because of universal trend of marking this anyway.
#5 - Radically 2-marking: map

$N=186$
#5 - Radically 2-marking: analysis

<table>
<thead>
<tr>
<th></th>
<th>Fisher’s</th>
<th>Randomized Chi2</th>
<th>.05-Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>34</td>
<td><em>p = .031</em></td>
<td><em>$\chi^2 = 4.63, p = .031$</em></td>
<td>$T_{add} = 0, T_{sub} = 0$</td>
</tr>
</tbody>
</table>

$N$ (randomizations) = 10,000
Summary of findings

- highly significant and relatively reliable enclave effects:
  - synthesis ($T_{sd}=1.2$): Himalayas and Caucasus
  - polyagreement ($T_{add}=4$, $T_{sub}=2$): Himalayas and Caucasus
  - conjunct/disjunct systems: Himalayas only

- significant, but relatively less reliable ($T_{add/sub}<2$) enclave effects:
  - bipartite stems: Himalayas and Caucasus (sample incomplete!)
  - radically double-marking: Himalayas only
  - multiple possessive classes: Himalayas only

** Enclave effects are not general accretion zone effects and demand locally specific explanations.**
Types of enclave distributions

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Distribution</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>De-Skewing Enclave</strong></td>
<td>The surrounding macroarea deviates from the universal norm; the enclave follows the universal norm.</td>
<td>Relative isolation allowed the enclave to revert to the universal default, unhampered by areal skewing pressure.</td>
</tr>
<tr>
<td><strong>Rarity Enclave</strong></td>
<td>The enclave contains a singularity or rarity found nowhere or almost nowhere else.</td>
<td>Relative isolation allowed undisturbed development and short-term preservation of (possibly unstable) rarities.</td>
</tr>
<tr>
<td><strong>Preservation Enclave</strong></td>
<td>The enclave reflects a distribution that is different from the surrounding macroarea but historically connected to it.</td>
<td>Relative isolation allowed preservation of a profile that characterized the surrounding macroarea before the population(s) of this macroarea migrated to a macroarea with which the enclave now shares the profile.</td>
</tr>
</tbody>
</table>
Testing enclave scenarios

#1a Related area?
- no
  - #2 Eurasia/rest
    - same
      - #3 Noneurasian areality?
        - yes
          - Independent areas
            - yes
              - Rarity E.
            - no
              - Independent areas
        - no
          - Independent areas
    - different
      - #3 Noneurasian areality?
        - yes
          - Independent areas
        - no
          - Independent areas
  - yes
  - #1b Encl/related area
    - different
      - Independent areas
      - yes
        - De-Skewing E.
      - no
        - Preservation E.
Testing enclave scenarios

Test 1 - possibly related area: Circumpacific (CP)

SYNTH, POLYAGR have the same distribution in the enclaves and the CP

Preservation enclave (reliable finding, $T_{add} > 4; T_{sd} = 1.2$)

** $p < .001$, * $p < .05$, ns $p > .2$, $N$ (rnd) = 10,000
## Testing enclave scenarios

### De-Skewing vs. Rarity scenarios (Tests 2-4)

<table>
<thead>
<tr>
<th></th>
<th>2 Eurasia/rest</th>
<th>3 Noneurasian areality</th>
<th>4 Enclave/Noneurasia</th>
<th>⊃. best-fitting scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>C/D</td>
<td>same</td>
<td>none</td>
<td>n/a</td>
<td>Rarity Enclave</td>
</tr>
<tr>
<td>BIPARTIT</td>
<td>$\chi^2=.16^{n.s.}$</td>
<td>$\chi^2=13.4^*$</td>
<td>n/a</td>
<td>Independent areality</td>
</tr>
<tr>
<td>2MARK</td>
<td>$\chi^2&lt;.01^{n.s.}$</td>
<td>$\chi^2=1.9^{ns}$</td>
<td>n/a</td>
<td>Rarity Enclave</td>
</tr>
<tr>
<td>MPOSSCL</td>
<td>$\chi^2=6.42^*$</td>
<td>$\chi^2=5.8^{ns}$</td>
<td>$\chi^2&lt;.01^{ns}$</td>
<td>De-Skewing Enclave</td>
</tr>
</tbody>
</table>

** p<.001, * p<.05, ns p > .2, N (rnd) = 10,000

- C/D, BIPARTIT, 2MARK enclaves do not seem to relate to any area
- Likely **Rarity enclaves** (but enclavehood T<2)

- MPOSSCL has the same distribution in the enclaves and outside Eurasia
- Likely **De-Skewing enclave** (but enclavehood T<2)
The De-Skewing Enclave Scenario

Himalayas vs. non-Eurasia: $\chi^2 < 0.01^{\text{ns}}$, $\mu = 16\%$

Himalayas vs. rest of Eurasia: $\chi^2 = 7.83^*$
The Preservation Enclave Scenario

Enclaves reflect what used to be the Eurasian standard before the Eurasian Steppe and SEA spreads and before the colonializations of the Americas.
The Preservation Enclave Scenario

Then, the Eurasian Steppe (Greater Silk Road) and SEA spreads revert these profiles, *except in the enclaves*. 
Conclusions

• The Eurasian macroarea is confirmed for two new variables (SYNTH/POLYAGR, MULT_POSS_CL).

• Himalayan and Caucasian languages are special because they deviate in several respects from the surrounding Eurasian typological profile.

• One of these deviations (SYNTH/POLYAGR) is best explained by the fact that the Himalayas and Caucasus are accretion zones that are originally connected (either by descent or contact) to the same circumpacific populations that colonialized the Americas.

• One deviation (MULT_POSS_CL) can perhaps be explained as a De-Skewing effect.

• Other deviations are probably due to independent arealities (BIPART) and/or rarities (2MARK, C/D).
